

Test Case

A **Test Case** is a documented set of steps, inputs, and conditions used to verify if a specific software requirement functions correctly.

Core Components

- **Title:** Brief name of the test (Ex- *Verify Login*).
- **Description:** The goal of the test.
- **Prerequisites:** Conditions met before starting (Ex-, *User is registered*).
- **Test Data:** Inputs used (Ex- , *Username/Password*).
- **Steps:** Sequence of actions to take.
- **Expected Result:** What the system *should* do if it works.

Importance of writing test cases

- **Requirement Coverage:** Ensures every feature is tested systematically so nothing is missed.
- **Traceability:** Maps specific tests to specific requirements to track what has been verified.
- **Reusability:** Allows different team members to execute or adapt the same tests, saving time and effort.
- **Consistency:** Standardizes the testing process so results are reliable and repeatable.

Test Scenario vs. test case

Test Scenario vs. Test Case		
Feature	Test Scenario	Test Case
Focus	"What" to test (High-level)	"How" to test (Low-level)
Derived From	Requirements	Test Scenarios
Format	One-line statement	Detailed step-by-step
Complexity	Simple & Broad	Precise & Specific
